Ex. 3 longe d'horloger.

si A' est au-delà du
$$PP$$
.

donc $A'E \ge dm$

càd $\overline{EA'} \le -dm$.

càd
$$\overline{EA'} \leqslant -dm$$
.

or $\overline{OA'} = \overline{OE} + \overline{EA'}$ et $\overline{OE} = +e$

donc $\overline{OA'} \leqslant e - dm$.

De plus
$$\frac{1}{\overline{\partial A'}} - \frac{1}{\overline{\partial A}} = \frac{1}{f'}$$

donc $\frac{1}{\overline{\partial A}} = \frac{1}{\overline{\partial A'}} - \frac{1}{f'}$

et
$$0 > \frac{1}{OA'} > \frac{1}{e - dm}$$

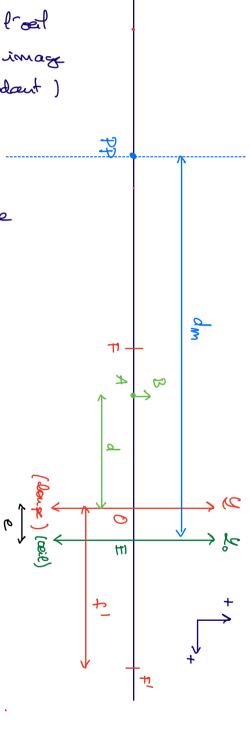

donc
$$-\frac{1}{f'}$$
 $\Rightarrow \frac{1}{\Theta A'} - \frac{1}{f'} \Rightarrow \frac{1}{e-dm} - \frac{1}{f'}$
 $\frac{1}{\Theta A} \Rightarrow \frac{1}{e-dm} - \frac{1}{f'}$

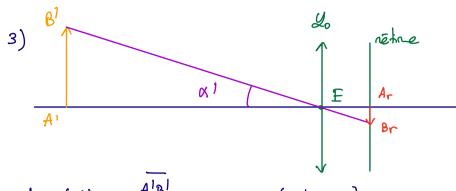

$$doc - f' \in OA \in \frac{f'(e-dm)}{f'-(e-dm)}$$

Finalement, comme
$$\partial A = -d$$

alors
$$\frac{f'(dm-e)}{f'-(e-dm)} \notin d \in f'$$

dmax

$$\tan (\alpha^1) = \frac{\overline{A^1 B^1}}{\overline{A^1 E}} \qquad (\alpha^1 > 0)$$

or
$$\overline{A'B'} = \overline{SAB} = \overline{SB}$$
 arec \overline{SB} le grandissement de la longe.

$$\frac{1}{\partial A_1} - \frac{1}{\partial A_2} = \frac{1}{A_1} = \frac{1}{A_2} + \frac{1}{A_2} = \frac{1}{A_1} - \frac{1}{A_2}$$

$$\frac{1}{\partial A_1} - \frac{1}{\partial A_2} = \frac{1}{A_2} + \frac{1}{A_2} = \frac{1}{A_1} - \frac{1}{A_2}$$

$$= \frac{1}{A_1} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_1} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_1} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_1} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_1} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_1} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_1} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_1} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_1} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_1} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

$$= \frac{1}{A_1} - \frac{1}{A_2}$$

$$= \frac{1}{A_2} - \frac{1}{A_2}$$

De plus
$$A'F = A'O + OE = -OA' + e = \frac{df'}{f'-d} + e$$

 $ban(\alpha') = \frac{\frac{f'h}{f'-d}}{e + \frac{f'd}{f'-d}} = \frac{f'h}{ef'-ed + f'd} = \frac{f'h}{ef'+d(f'-e)}h$

4). A.N. e = 1 cm; f' = 5 cm; $d_m = 25 cm$; h = 1 mm.

Om knowe $\alpha_{mim} = 0.021 \text{ rad.}$ $\alpha'_{max} = 0.025 \text{ rad.}$ $\alpha'_{o} = \tan(\alpha_{o}) = \frac{1}{d_{m}} \left(\frac{1}{\Delta_{o}} \right) \left(\frac{1}{\Delta_{o$

Rq: Si on place f oct an mixture du forçe principal image de la longe (càd e=f') alos α' $\alpha'=\frac{h}{f'}$ indépendant de d. On retrouve le grassissement commercial $G=\frac{dm}{f'}$ quelle que soit la distance d.
